File and Directory Restoration

Steps:

Full Backup

This feature allows you to create an archive of all the files and configurations on your website.

Full Backup

Note: You can only use this option to move your account to another server or to download a copy of your account. You cannot restore Full Backups through your cPanel interface.

Select Partial Backup

This feature allows you to select which partial backup you want to download.

Home Directory

MySQL Databases

Email Forwarders & Filters

← Go Back

Full Backup : Backup Keseluruhan

Home Directory : Backup pada bagian Folder Home

MySQL Databases : Backup Database

Email Forwarders & Filters : Backup Email

Pilih **Restore** kemudian
pilih **Restore Type**

Select Restore Type

This feature allows you to select what to restore.

Home Directory

MySQL Databases

Email Forwarders

Email Filters

Restore

This feature allows you to upload an existing backup file.

The system will restore the following items:

- The home directory.
- MySQL® databases.
- Email forwarder configurations.
- Email filter configurations.

Restore

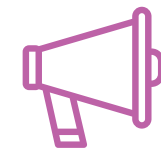

✓ Maintenance Terkena Hack (apabila website menggunakan wordpress) ⁷

Langsung Saja Restore.

Apabila ada File Backup yang terakhir update

Apabila tidak ada / Lupa **Backup**
Secara Berkala

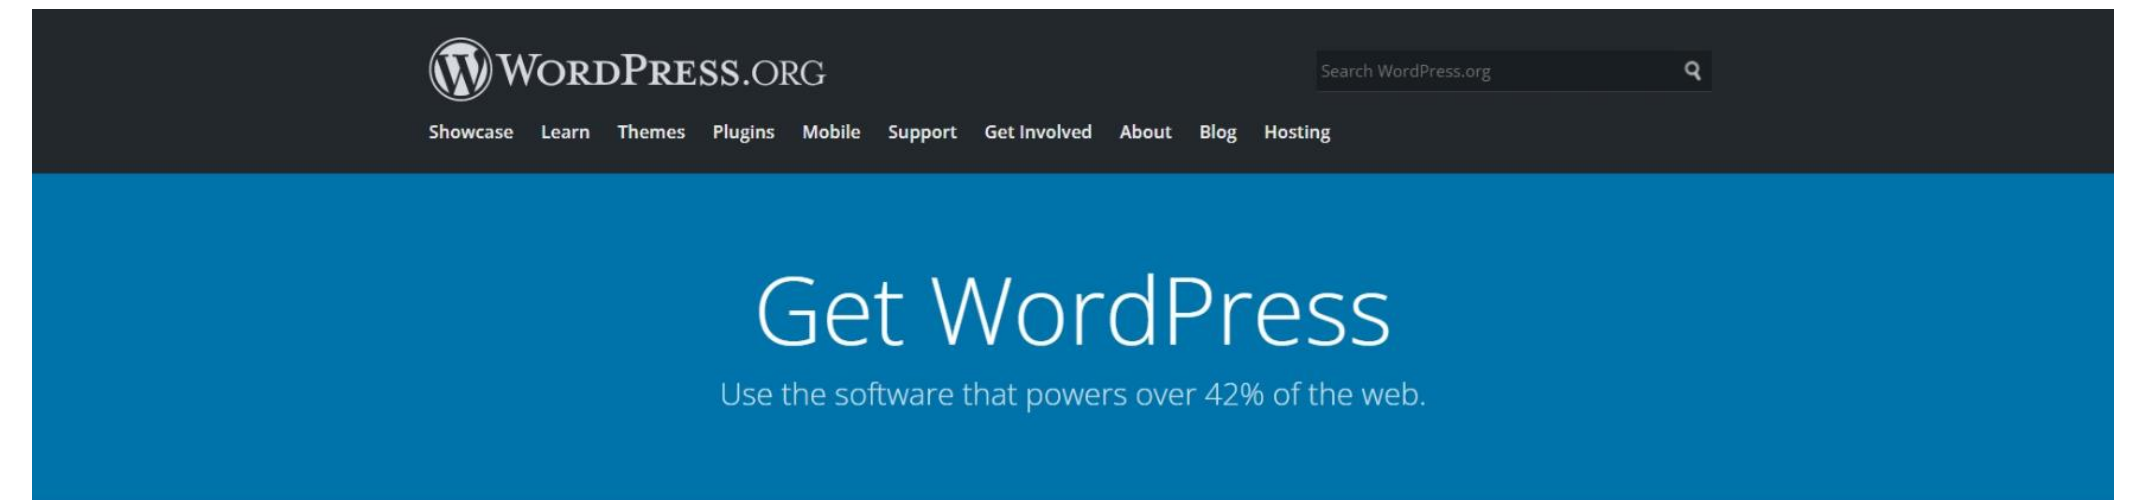

Download File Wordpress.

Lakukan Update file Wordpress MANUAL

✓ Buka Halaman <https://wordpress.org/download/>

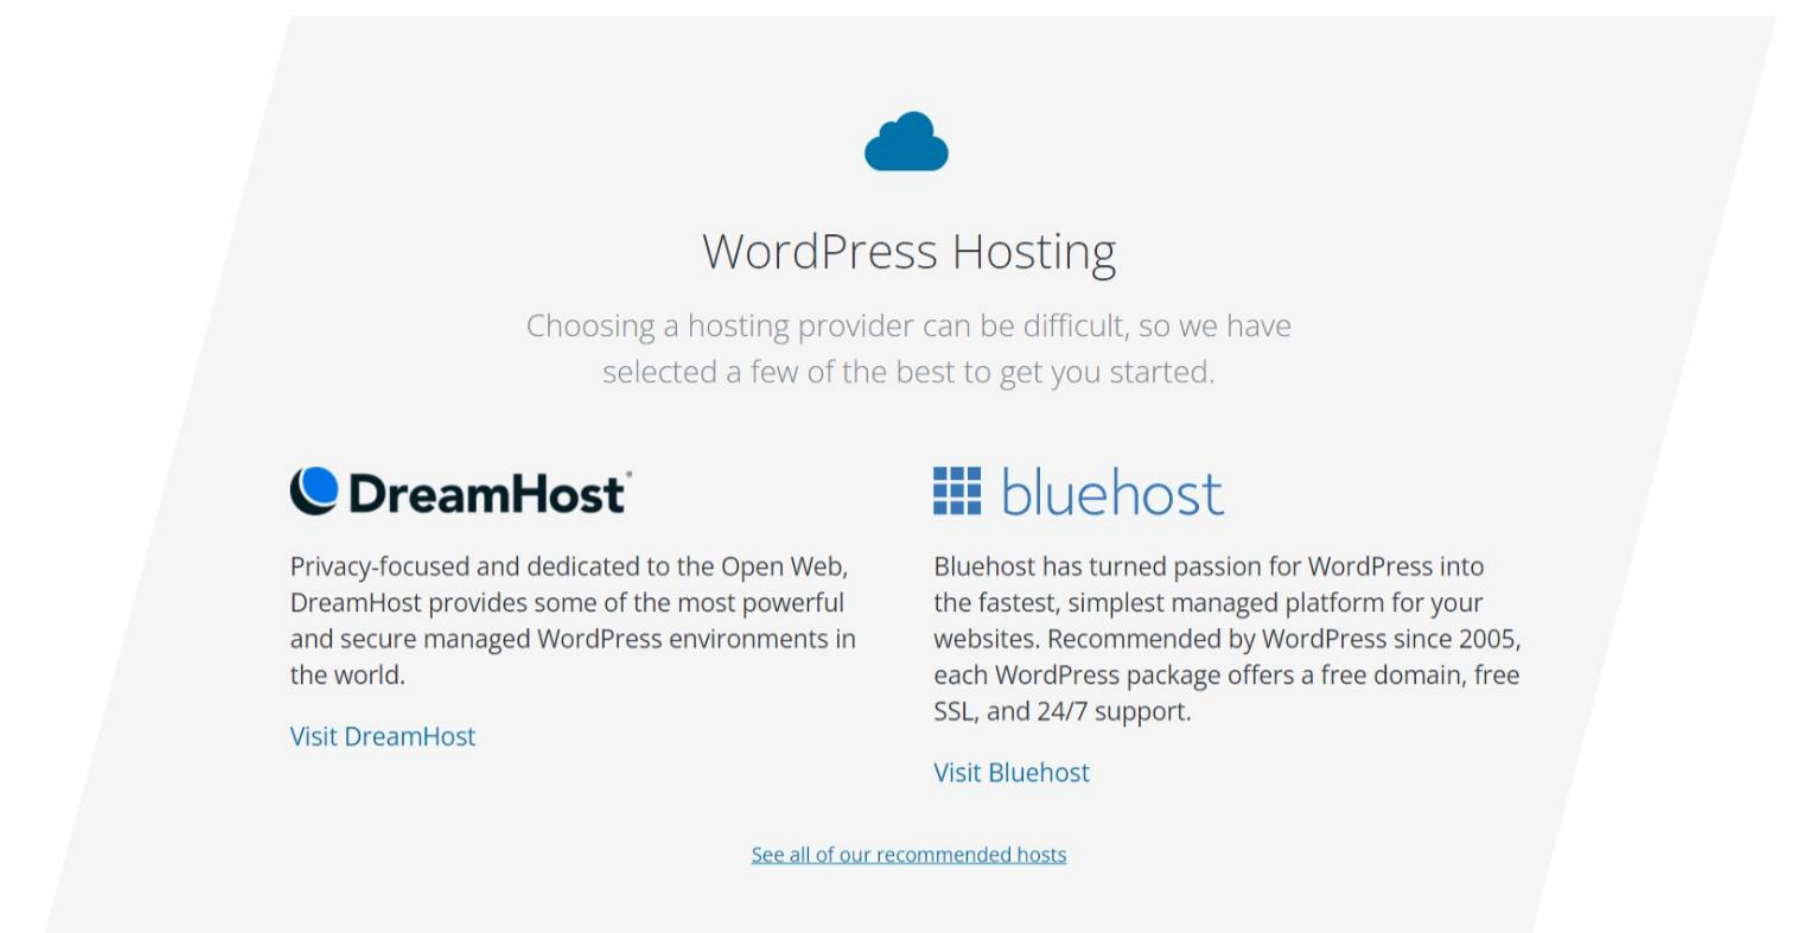

8

Pilih Download wordpress 5.8.1

There are several ways to get WordPress. The **easiest** is [through a hosting provider](#), but sometimes **tech-savvy** folks prefer to [download and install](#) it themselves.

Either way, you can use your WordPress through a web browser and with [our mobile apps](#).

Priceless, and also free

Download WordPress and use it on your site.

 Download WordPress 5.8.1

[Download .tar.gz](#)

MultiPHP INI Editor

The MultiPHP INI editor writes to the .htaccess, .user.ini, and php.ini files. The system will only write a directive to a file if it is a valid directive for that file type. For more information, read our [MultiPHP INI Editor documentation](#).

Basic Mode

Editor Mode

Configure PHP INI basic settings

Select the home directory or a domain's document root to open the corresponding PHP configuration.

pkk.banjarbarukota.go.id

Path /home/pkkbanjarbaru/public_html/php.ini

PHP Version ea-php73

Domain pkk.banjarbarukota.go.id

PHP Directive	Information	Setting
display_errors	This determines whether errors should be printed to the screen as part of the output or if they should be hidden from the user.	☐ Disabled
max_execution_time	This sets the maximum time in seconds a script is allowed to run before it is terminated by the parser. This helps prevent poorly written scripts from tying up the server. The default setting is 30.	30
max_input_time	This sets the maximum time in seconds a script is allowed to parse input data, like POST, GET and file uploads.	60
max_input_vars	This sets the maximum number of input variables allowed per request and can be used to deter denial of service attacks involving hash collisions on the input variable names.	1000
memory_limit	This sets the maximum amount of memory in bytes that a script is allowed to allocate. This helps prevent poorly written scripts for eating up all available memory on a server. Note that to have no memory limit, set this directive to -1.	32M
post_max_size	Sets max size of post data allowed. This setting also affects file upload. To upload large files, this value must be larger than upload_max_filesize. Generally speaking, memory_limit should be larger than post_max_size.	20M
session.gc_maxlifetime	This specifies the number of seconds after which data will be seen as "garbage" and potentially cleaned up.	1440
session.save_path	session.save_path defines the argument which is passed to the save handler. If you choose the default files handler, this is the path where the files are created.	/var/cpanel/php/sessions/ea-php56
upload_max_filesize	The maximum size of an uploaded file.	20M
zlib.output_compression	Whether to transparently compress pages. If this option is set to "On" in php.ini or the Apache configuration, pages are compressed if the browser sends an "Accept-Encoding: gzip" or "deflate" header.	☐ Disabled

Subdomains

A subdomain is a subsection of your website that can exist as a new website without a new domain name. Use subdomains to create memorable URLs for different content areas of your site. For example, you can create a subdomain for your blog that is accessible through **blog.example.com** and **www.example.com/blog**

Create a Subdomain
